

Gallery Series

The Gallery Wall Screen is a custom frame available in a wide array of custom materials, finishes, and colors to match any décor and create the visual appeal of a fine-art presentation

Gallery Series

The Gallery Wall Screen is a custom screen frame with an elegant, sculpted shape that is available in a wide variety of materials, finishes and colors. Creating a visual appeal much like a fine art presentation, the Gallery screen frame can be matched to any room's décor, enabling visual integration into a variety of environments where the appearance of a square-bordered projection screen may be incompatible, whether in board rooms, high-end museum or digital signage presentations, or homes.

With each frame custom built to order, the Gallery Wall Series provides designers and architects with a rich palette of materials, textures and colors to choose from, including the ability to use custom, designer-specified colors and textures. Specialized architectural frame finishes include brushed aluminum, satin anodizing and powder coating. Each is available in an extremely wide range of color options that include color chip matching. Frames that will be finished on site can be provided with paint-grade primer finishing. Custom fabrication of the frame is possible, with materials including leather, linen, and even crystals, with additional options limited only by the designer's creativity.

The Gallery frame can be used with the entire range of Stewart Filmscreen's award-winning front and rear projection materials, including both fabric and glass. To create the finishing touch to the visual experience, Stewart's optional black VeLux trim can be used to perfectly frame the video image within the inside edge of the frame.

Facilitating installation, Stewart has created a new wall mounting system for the Gallery Series that includes leveling vials and a simplified corner key design. Both traditional aperture mounts and specialty mounts are available and Stewart's "Z" bar quick mounting system makes for easy and rapid mounting of the frame.
